WPI; 95-206931/27.

WPI; 95-206931/27.

Identifying gene signatures in 3'-directed human cDNA library - e.g. Identifying gene signatures in 3'-directed human cDNA hat that reflects relative abundance of corresp. mRNA in specific human tissues.

Trissues.

Claim 1; Page 1068; 2245pp; Japanese.

A single-stranded DNA (or its complementary strand or the corresp. A single-stranded DNA which comprises one of the 7837 "Gs" sequences given in T19001-T26837 and which is able to hybridise to part of human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) concerned by human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) concerned by human genomic DNA was initiated from the corresp various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-end of mRNA in the particular tissue from which it was derived. It constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for recognising different cell types.

Claim 3; Page 14; 23pp; English.
Oligonucleotide probe MK14-A consists of nucleotides
(Q51735). It hybridized to all spp. of mycobacteria
cross reacted to a few non-mycobacterial spp. The pr
be useful as an initial screen for mycobacterial infe

Tidentifying proteins or peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins comprising a binding domain and an effector domain proteins comprising a binding domain and an effector domain proteins comprising a binding domain and an effector domain proteins of the screening a generic DNA sequence used to generate random TSAR (Totally Synthetic Affinity Reagents) peptides. This generic formula can also be represented as follows: X(NNB)6(TGC)(NNB)11Z(NNB)14(TGC)(NNB)3Y. X and Y are flanking restriction sites (X is not the same as Y) that are not specified further. Other generated by these generic sequences are shown in R65151-54. TSARs are concatenated heterofunctional proteins or peptides. Other specific peptides generated by these generic sequences are shown in R65151-54. TSARs are concatenated heterofunctional proteins or peptides. Comprising at least two functional regions - a binding domain with comprising at least two functional regions - a binding domain with a schemically or biologically active. They may further comprise a linker peptide between the 2 domains. The oligonucleotides are also designed so that the expressed peptide contains 2 or 4 cysteine residues residues confer some degree of conformational rigidity to the peptides. The TSARs or compsns. comprising a TSAR binding domain can be used in vivo to deliver a chemically or biologically active moiety, es metal ion, calliver a chemically or biologically active moiety, es metal ion, calliver a chemically or biologically active moiety, es metal ion, collines methods of hybridoma formation of macromolecules, es. Conduction of macromolecules, escaped by both or complex methods of hybridoma formation of macromolecules, escaped by bridoma formation of macromolecules.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ļ

Random point mutations were introduced into the alpha fragment of Random point mutations were introduced into the alpha fragment of E.coli beta-galactosidase. The wild type sequence was obtained as single stranded template and an oligonucleotide was hybridised to it to generate a popn of DNA molecules which terminate at all possible nucleotide positions within a specified region. The variable 3' ends generated in this way are used as primers for reverse transcriptase. Nucleotides are misincorporated by the transcriptase and the molecules are completed to forms that can be amplified and then expressed in a suitable host-vector system. The sequence covers all 176 difft base substitutions, most of which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ø

This generic DNA sequence used to generate random TSAR peptide
This generic formula can be represented as follows: X(TGC)(NNB)10-
C (TGC)(NNB)2(TGC)(NNB)14(TGC)Y. X and Y are flanking restriction
sites (X is not the same as Y) that are not specified further. This
sequence generates peptides that are cloverleaf in structure. Other
c generic sequences are shown in Q70465-68. Other specific peptides
c generated by these generic sequences are shown in R65150-54. TSARS are
concatenated heterofunctional proteins or peptides, comprising at least
two functional regions - a binding domain with affinity for a ligand and
a second effector peptide portion that is chemically or biologically
c active. They may further comprise a linker peptide between the 2 domains.
The oligonucleotides are also designed so that the expressed peptide
contains 2 or 4 cysteine residues positioned in, or flanking, the
unpredicted or variant residues positioned in, or flanking, the
unpredicted or variant residues. These residues confer some degree of
conformational rigidity to the peptides. The TSARS or compsns. comprising
a TSAR binding domain can be used in vivo to deliver a chemically or
biologically active molety, eg. metal ion, radiolsotope, peptide, toxin
or enzyme, to the specific target or on the cell. They can also replace
the function of macromolecules, eg. monoclonal or polyclonal antibodies

The function of macromolecules, eg. monoclonal or polyclonal antibodies

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Identifying proteins or peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins comprising a binding domain and an effector domain bisclosure; Page 35; 255pp; English.

Q70468 is a generic DNA sequence used to generate random TSAR (Totally Synthetic Affinity Reagents) peptides. This generic formula can also be represented as follows: X(NNB)11(TGC)(NNB)6Z(NNB)7(TGC)(NNB)10Y. X and Y are flanking restriction sites (X is not the same as Y) that are not specified further. Other generic sequences are shown in Q70466-68. Other specific peptides generated by these generic sequences are shown:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                070468;

               comprising at least two functional regions - a binding domain with affinity for a ligand and a second effector peptide portion that is chemically or biologically active. They may further comprise a linker peptide between the 2 domains. The oligonucleotides are also designed so that the expressed peptide contains 2 or 4 cysteine residues positioned in, or flanking, the unpredicted or variant residues. These residues confer some degree of conformational rigidity to the peptides. The TSARs or comprising a TSAR binding domain can be used in vivo to deliver a chemically or biologically active moiety, eg. metal ion, radioisotope, peptide, toxin or enzyme, to the specific target or on the cell. They can also replace the function of macromolecules, eg. monoclonal or polyclonal antibodies and therefore circumvent the need for complex methods of hybridoma formation or in vivo antibody production. The TSARs are easily characterised and have designed activity allowing direct and rapid detection in a screening process.
                                                                                                                                                                                                                                                                                                                                                          activity

Identifying proteins or peptide(s) which bind a ligand - by accombinant vector library expressing fusion proteins comprising a binding domain and an effector domain comprishing a binding domain and an effector domain can also be specified the proteins of peptides. This generic formula can also be represented as follows: X(NNB) 11,7CC/(NNB) 52(NNB) 7(TCC)(NNB) 10.

activity (especially at pH values in the range of 8.5-10.5), and improved binding of a particular substrate. These variant alpha-amylases also possess improved specificity to a particular substrate, and/or improved specificity with respect to cleavage of substrate. These sequences can be used in detergent and washing compositions, and for textile desizing. The alpha-amylase variants can also be used in papermaking and beer-making processes. These variants can also be used in the production of sweeteners and ethanol from starch.

Alpha-amylase variant deital81 + deital82.

Will of Alpha-amylase variants of the modernection; sweetener.

Synthetic.

mutagenesis of the DNA sequences encoding the parent alpha-amylases represented by W12955, W12956, R81835 and R81836. W12137-W12140, and C w12143 are specifically variants of the alkaphilic Bacillus strain NCIB 12513 alpha-amylase shown in R81836. These variants can have improved thermal stability (such as at temperatures in the range of 40-70 degrees C celcius), and/or oxidation stability, and/or reduced calcium ion dependency. The variants can also have increased alpha-amylolytic activity (especially at pH values in the range of 8.5-10.5), and improved binding of a particular substrate. These variant alpha-amylases also possess improved specificity to a particular substrate, and/or improved specificity with respect to cleavage of substrate. These sequences can be used in detergent and washing compositions, and for textile desizing. The alpha-amylase variants can also be used in papermaking and beer making processes. These variants can also be used in the production
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                production
